#### **DETAILED ACTION**

### Election/Restrictions

1. Applicant's election of Group I (claims 1-32) in the reply filed on 10/12/2007 is acknowledged. Because applicant did not distinctly and specifically point out the supposed errors in the restriction requirement, the election has been treated as an election without traverse (MPEP § 818.03(a)).

### **Drawings**

2. Figure 1 should be designated by a legend such as -- Prior Art-- because only that which is old is illustrated. See MPEP § 608.02(g). Corrected drawings in compliance with 37 CFR 1.121(d) are required in reply to the Office action to avoid abandonment of the application. The replacement sheet(s) should be labeled "Replacement Sheet" in the page header (as per 37 CFR 1.84(c)) so as not to obstruct any portion of the drawing figures. If the changes are not accepted by the examiner, the applicant will be notified and informed of any required corrective action in the next Office action. The objection to the drawings will not be held in abeyance.

## Claim Rejections - 35 USC § 102

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

10/552,672

Art Unit: 2618

A person shall be entitled to a patent unless -

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United

States.

3. Claims 1-4, 18-21 are rejected under 35 U.S.C. 102(b) as being anticipated by

Donahoo, M.J.; Ainapure, S.R., "Scalable multicast representative member selection,"

INFOCOM 2001. Twentieth Annual Joint Conference of the IEEE Computer and

Communications Societies. Proceedings. IEEE, vol.1, no., pp.259-268 vol.1, 2001,

hereinafter "IEEE document".

Regarding claim 1, the IEEE discloses a method for providing scalable reliable

multicast service (page 259, see abstract and introduction) comprising: transmitting a

group of data packets over a communication medium to a group of receivers designated

by a multicast address (such as sending video data to the group of receivers, see page

259 and the introduction); receiving over the communication medium from the group of

receivers acknowledgement packets, each acknowledgement packet representing a

failure by one of the receivers to receive a number of the data packets specified by the

acknowledgement packet (pages 259-263).

Regarding claim 2, it is inherent that the communication medium comprises a

first data link for transmitting packets from the sender to the receivers, and a second

data link for transmitting packets from the receivers to the sender.

Regarding claim 3, the IEEE document further discloses that the communication

medium is divided into time slots and wherein, during receiving, each time slot is

assigned to the receivers for acknowledging a failure to receive a specified number of

data packets (pages 260-263 from section II RELATED WORK to III BACKOFF TIMER).

Regarding claim 4, since the receivers with the poorer quality has the smaller backoff timer that the receivers with better quality (see page 261 section A. Targeted Slotting and Damping), it is inherent that specified number of data packets not received is implicitly specified by the position of each time slot.

Regarding claims 18-21, these claims are the obvious receiving method as opposed to the transmit method of claims 1-4 and are therefore rejected for the same reasons.

# Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

- (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- Claims 5, 22 are rejected under 35 U.S.C. 103(a) as being unpatentable over the IEEE document in view of Applicant's admitted prior art.

Regarding claim 5, the IEEE document discloses the invention but does not disclose that wherein a collision detected during receiving in a time slot is deemed to be equivalent to receiving an acknowledgement packet in that time slot. As disclosed by Applicant in paragraph [0016], the collision of an ACK and a NACK packet is treated as a negative acknowledgement. Therefore, it would have been obvious to a person of ordinary skill in the art at the time of the invention to combine the teaching of Applicant 10/552,672 Art Unit: 2618

admitted prior art to the teaching of the IEEE document. The motivation for combining would be for the sender to know that a packet has been delivered.

Regarding **claim 22**, this claim is the obvious receiving method as opposed to the transmit method of claim 5 and is therefore rejected for the same reasons.

5. Claims 6-8, 23-25 are rejected under 35 U.S.C. 103(a) as being unpatentable over the IEEE document in view Kelly et al. (hereinafter "Kelly"; U.S. Patent Number 6,834,039).

Regarding **claim 6**, the IEEE document discloses the invention but does not explicitly disclose that the sending a control packet to the receivers specifying an allocation of the communication medium for transmitting the data packets and for the receivers to send the acknowledgement packets.

In an analogous art, Kelly teaches a bandwidth allocation scheme for TCP/IP system over a TDMA based network. Kelly further teaches that the system specifies the allocation of the communication medium for transmitting the data packets and for the receivers to send the acknowledgement packets (column 8, specifically lines 7-47, column 14 lines 34-50).

Therefore, it would have been obvious to one of ordinary skill in the art, at the time the invention was made to apply the teaching of Kelly to the system disclosed by the IEEE document. The motivation for doing so would be to allow for faster recovery of inroute packets errors.

Regarding **claim 7**, Kelly further discloses that the data packets include one or more forward error correcting parity packet (FEC) prepared in response to an acknowledgement packet received (column 8 lines 19-47, column 20 tables 6-7).

Regarding **claim 8**, the combination of the IEEE document and Kelly discloses the invention but does not disclose that the number of FEC parity packets prepared corresponds to the largest number of data packets failed to be received by a receiver, as indicated by the acknowledgement packets received. However, it would have been obvious to a person of ordinary skill in the art at the time of the invention to have the FEC parity packets prepared corresponds to the largest number of data packets failed to be received by a receiver, as indicated by the acknowledgement packets received so that an appropriate amount (packets) can be resend to the receiver(s).

Regarding **claims 23-25**, these claims are the obvious receiving method as opposed to the transmit method of claims 6-8 and are therefore rejected for the same reasons.

6. Claims 9, 26 are rejected under 35 U.S.C. 103(a) as being unpatentable over the IEEE document in view Kelly and in further view of Kwak (U.S. Patent Number 7149,192).

Regarding claim 9, the combination of the IEEE document and Kelly discloses the invention but does not disclose the steps of storing the data packets and the FEC parity packets in a multicast buffer until a sufficient number of data packets and FEC parity packets are deemed received by the receivers.

10/552,672

Art Unit: 2618

In an analogous art, Kwak teaches a base station for implementing a physical layer automatic request. Kwak further discloses the steps of storing the data packets and the FEC parity packets in a multicast buffer until a sufficient number of data packets and FEC parity packets are deemed received by the receivers (claim 13).

Therefore, it would have been obvious to one of ordinary skill in the art, at the time the invention was made to apply the teaching of Kwak to the system disclosed by the IEEE document and Kelly. The motivation for doing so would be to clear the buffer once all packets have been sent to allow more space for future packets in the buffer memory.

Regarding **claim 26**, this claim is the obvious receiving method as opposed to the transmit method of claim 9 and is therefore rejected for the same reasons.

7. Claims 10-11, 27-28 are rejected under 35 U.S.C. 103(a) as being unpatentable over the IEEE document in view Maxemchuk et al. (hereinafter "Maxemchuk"; U.S. Patent Application Publication Number 2004/0078624 A1).

Regarding **claim 10**, the IEEE document discloses the invention but does not explicitly disclose the transmitting one or more forward error correcting parity packet (FEC) proactively in anticipation of failure by the receivers to receive one or more of the data packets.

In an analogous art, Maxemchuk teaches a system and method for the repair of IP multicast sessions. Maxemchuk further teaches disclose the transmitting one or more forward error correcting parity packet (FEC) proactively in anticipation of failure by the

receivers to receive one or more of the data packets (paragraphs [0015], [0024], [0135]).

Therefore, it would have been obvious to one of ordinary skill in the art, at the time the invention was made to apply the teaching of Maxemchuk to the system disclosed by the IEEE document. The motivation for doing so would be to increase the reliability of its response.

Regarding **claim 11**, Maxemchuk further discloses that the data packets include data packets of a plurality of multicast messages (abstract).

Regarding claims 27-28, these claims are the obvious receiving method as opposed to the transmit method of claims 10-11 and are therefore rejected for the same reasons.

8. Claim 17 is rejected under 35 U.S.C. 103(a) as being unpatentable over the IEEE document.

Regarding claim 17, the IEEE document discloses the invention but does not explicitly disclose the steps of receiving a positive acknowledgement package from a selected one of the receivers. However, since the document discloses that a NACK is sent back to the transmitter from the receiver (page 260, section II. Related Work), it would have been obvious and well within the level of a person of ordinary skill in the art to modify the teaching of the IEEE document to also send a positive acknowledgement package from a selected one of the receivers. The motivation for sending a positive

Application/Control Number:

10/552,672

Art Unit: 2618

Page 9

acknowledgement package is to let the sender / transmitter that a good packet has

been received so that the sender / transmitter can continue to send additional package.

Allowable Subject Matter

9. Claims 12-16, 29-32 are objected to as being dependent upon a rejected base

claim, but would be allowable if rewritten in independent form including all of the

limitations of the base claim and any intervening claims.

Regarding claims 12 and 29, the applied references fail to disclose or render

obvious the claimed limitations, wherein the communication medium is multiplexed

between a first data link for transmitting packets from the sender to the receivers, and a

second data link for transmitting packets from the receivers to the sender, the first data

link and the second data link each being provided a time period for data transmission of

a predetermined duration before yielding the communication medium to the other data

link.

Conclusion

Any inquiry concerning this communication or earlier communications from the

examiner should be directed to Sonny TRINH whose telephone number is 571-272-

7927. The examiner can normally be reached on Monday-Thursday.

Application/Control Number:

10/552,672

Art Unit: 2618

Page 10

If attempts to reach the examiner by telephone are unsuccessful, the examiner's

supervisor, Edward URBAN can be reached on 571-272-7899. The fax phone number

for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the

Patent Application Information Retrieval (PAIR) system. Status information for

published applications may be obtained from either Private PAIR or Public PAIR.

Status information for unpublished applications is available through Private PAIR only.

For more information about the PAIR system, see http://pair-direct.uspto.gov. Should

you have questions on access to the Private PAIR system, contact the Electronic

Business Center (EBC) at 866-217-9197 (toll-free). If you would like assistance from a

USPTO Customer Service Representative or access to the automated information

system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.
